

Peach twig borer (PTB) trap catch and degree days calculation-2016

Jhalendra Rijal, IPM Advisor,
UC Cooperative Extension-Stanislaus
rijal@ucanr.edu; 209-525-6800

Degree days were calculated by using UC-IPM Degree days calculation link:

<http://www.ipm.ucdavis.edu/calludt.cgi/DDMODEL?MODEL=PTB&CROP=almonds>

The weather station used to calculate DD is CIMIS Station # 206 (i.e. Denair II)

Peach twig borer model

Lower/upper threshold: 50/88°F

Calculation/upper cutoff method: single sine/horizontal

Biofix: The biofix is the first date that male moths are caught consistently in pheromone traps.

Biofix Date: 28 March 2016

Additional information: [Pest Management Guidelines](#)

Typical generation periods and spray timing

Generation Length (degree-days)			Spray Timing (degree-days)	
1st	2nd	3rd	Early Generation	Later Generations
1030	1030	1030	400-500	300-400

jrijal@ucanr.edu; 209-525-6800

Degree days were calculated by using UC-IPM Degree days calculation link:

<http://www.ipm.ucdavis.edu/calludt.cgi/DDMODEL?MODEL=NOW&CROP=almonds>

The weather station used to calculate DD is CIMIS Station #206 (i.e. Denair II)

Navel orangeworm model

Lower/upper threshold: 55/94°F

Calculation/upper cutoff method: single sine/horizontal

Biofix: The first biofix is the beginning of a consistent increase in egg laying on egg traps.

When at least 75% of the egg traps in a given location show increases in the number of eggs on two consecutive monitoring dates, the biofix is the first of those two dates.

Biofix Date:
